

RankRabbit AI Launches Social AI to Manage Multi-Location Social Media From One Dashboard

Published: September 3, 2026 | Company: RankRabbit AI | By: Nelson

PEARLAND, Texas Sept. 3, 2026 RankRabbit AI, a marketing visibility platform based in Pearland, Texas, today announced the launch of Social AI, a product built to manage social media accounts across multiple business locations from a single interface. Social AI is one of four products in the RankRabbit AI suite, joining Search AI, Listing AI and Reputation AI, and is aimed at multi-location brands and agencies that have historically managed each location's social presence separately.

For a business with more than a handful of locations, keeping social accounts current across platforms such as Facebook, Instagram, TikTok, YouTube and Pinterest has typically meant logging into each account separately, or relying on scattered spreadsheets and calendars to keep messaging consistent. Social AI consolidates that work into one dashboard, giving brands and the agencies that manage them a single place to publish, monitor and report across every location at once.

The product is also built with an eye on how customers now discover businesses in the first place. A growing share of searches happen inside social apps themselves, or get folded into the same AI-generated answers that now cite reviews and listings alongside traditional search results. Keeping a brand's story consistent across every

social account, not just its website and Google Business Profile, has become part of the same visibility problem RankRabbit AI's other products are built to solve.

Social AI joins Search AI, Listing AI and Reputation AI in the RankRabbit AI suite, which together are designed to track and manage a brand's visibility across search engines, AI platforms, local listings, social media and reputation sites from a single dashboard.

We kept hearing the same story from multi-location clients: one team managing twenty different logins, twenty different posting schedules, and no real way to tell if any of it was consistent. Social AI puts all of that in one place, so a brand can actually see what every location is posting instead of hoping it lines up, said Harsh Jangid, Tech Lead, RankRabbit AI.

Social used to be treated as separate from search. It isn't anymore customers are discovering businesses inside these apps directly, and AI systems are reading what's posted there too. Social AI was built so that side of a brand's presence gets the same visibility as everything else in the suite, said Hastimal Jangid, Founder, RankRabbit AI.

About RankRabbit AI

RankRabbit AI is a Pearland, Texas-based marketing visibility platform that helps businesses track, analyze and improve their rankings across search engines, AI platforms, local listings, social media and reputation sites. Its suite includes four products Search AI, Listing AI, Social AI and Reputation AI built to give brands a single dashboard for managing visibility as customer discovery shifts from traditional search boxes to AI-generated answers and social platforms.
